IMPROVING EMPLOYEE RETENTION IN SENIOR LIVING WITH TECHNOLOGY

Senior living communities are adopting a resort-style hospitality approach to accommodate changing resident needs. This change in practice is largely a result of the technologically savvy baby boomer generation. Because of this, owners need to provide an engaging community experience in addition to medical care.

Technology Enhances Resident Experiences

Technology is an important factor in delivering resort-style hospitality to senior living. In today's connected world, many older adults expect advanced technologies when choosing a community.

Technology elevates the resident experience. Just as hotel guests want access to their favorite shows, senior living residents expect the same. Something as simple as a curated channel lineup can greatly improve resident satisfaction.

Enhanced Entertainment and IoT Increases Safety

Over-the-top solutions like WCI's WorldVue platform facilitate easy communication between management and residents. Communities can use the customizable in-house channel to display activities, dining options, events, on-site services, and more.

Smart technology is making its way into senior living communities. Residents can control features like the lighting and HVAC in their rooms with a touch of a button using IoT. Utilizing smart technology helps residents live an independent lifestyle.

ENCOURAGING EXCEPTIONAL CARE EXPERIENCES

ImpruviX provides high-performance networks for a seamless technology experience. ImpruviX ensures residents and staff are constantly connected through reliable connectivity and smart room technology. Furthermore, we focus not only on resident comfort but staff supplementation as well. Our software features a technology monitoring system so senior living staff can assist residents remotely, reducing the time spent in individual rooms.

EASE OF ACCESSIBILITY

Technologies create a safe space for your residents. ImpruviX creates a smart space for seniors, combining ease of access with improved security. ImpruviX Surveillance, powered by Eagle Eye Networks, monitors restricted areas with best-in-class access control integrations and is fully HIPAA compliant. The VMS is a simple, scalable, and cost-effective way to monitor for property patient care, protect valuable assets, and ensure staff is meeting all health and safety standards.

SMART TECHNOLOGY IS ESSENTIAL FOR RESIDENT SAFETY AND SECURITY

ImpruviX enables senior living staff to provide superior service with remote monitoring systems. Our monitoring system can alert staff when a resident goes beyond a set boundary or moves about the room during a fall-risk situation. Additionally, the ImpruviX security system can alert staff if an approaching visitor is running a fever and can provide analytics for how many people are in and out of the building. Furthermore, the increased accessibility also provides superior legal security. Our monitoring system is HIPPA compliant and can save video content for a customizable set of time, ranging from days to years. Our monitoring system ensures your staff is protected.

CONNECTIVITY

PROFESSIONAL SERVICES

SAFETY

Resident safety is the most important aspect of senior living communities. The hiring deficit means nurses and senior living support staff must divide their time in accordance with the necessary levels of care. ImpruviX Surveillance acts as a second pair of eyes, monitoring movements and sending alerts if residents are behaving erratically or crossing pre-determined boundaries. In common areas, ImpruviX Surveillance can count the number of visitors/residents and monitor healthy temperatures, notifying staff if a resident or guest is running a high fever. Senior living facilities can also use these statistics to adapt their heating/cooling systems to accommodate the influx of people to common areas during specific times of the day.

LEAK DETECTORS

Additionally, ImpruviX employs advanced leak detectors to determine if there is any unnecessary or unhealthy fluctuation in air quality. These sensors can alert staff if there is a rise in natural gas or other poisonous gas leaks within a resident's area. The program can also notify staff if there is a window open past a certain time of day/night to further protect residents from outside allergens or particularly cold winter nights. Empower senior living staff and increase resident safety with ImpruviX solutions.

COMMUNITY MESSAGING

Investing in digital communication solutions means staff isn't held back by antiquated systems like physical menu distribution and time-sensitive messaging. Empower senior living staff by giving them advanced capabilities to save time and better inform residents of community-wide engagements or timely updates.

The system is user-friendly, allowing the property to completely control the messaging they send out to residents. This easy-to-use digital signage solution empowers care providers to communicate quickly and easily so they can spend their time performing more meaningful activities like relationship building.

YOUR TRUSTED TECHNOLOGY PARTNER

IN CONCLUSION

Resident safety is of utmost importance to community staff, residents, and their loved ones. Cloud-based surveillance solutions help community staff monitor residents as needed. For instance, security is especially beneficial in memory care communities. Staff can receive alerts when there is movement detected in any pre-set locations. These solutions allow community staff to keep residents safe while also maintaining their privacy.
